

Demo Video Script

Week 3, Student Motivation & Engagement Survey

Target length: 7 minutes. Range 5 to 10 minutes acceptable.

Face visible throughout. HD recording (1080p minimum).

Setup checklist before recording:

- Camera at eye level, natural lighting from the front, clean background.
- Good audio: quiet room, mic close, no fan noise.
- Screen recording plus webcam overlay (bottom-right, small). Loom, OBS, or Windows Xbox Game Bar all work.
- Have these tabs open in order: Google Form builder, Responses tab, Excel workbook, Findings Report PDF, Presentation deck.
- Do one full practice run without recording. Then record.

OPENING (0:00 to 0:45)

[0:00] Camera on you, no screen share yet.

Speak naturally, don't read stiffly.

"Assalam u Alaikum, my name is Yashal Manaïem Javaid. I'm a Psychology intern at SafeX Solutions, and I'm part of Group 43. In this video I'll walk you through my Week 3 project, which was a survey on student motivation and engagement, and the design recommendations it produced for the educational platform we're working on.

I'll take you through four things: the survey I designed, the responses I collected, the analysis I did, and the three main findings with their design recommendations. This should take about seven minutes."

PART 1: THE SURVEY (0:45 to 2:00)

[0:45] Switch to screen share, open Google Form builder.

On-screen: Google Forms edit view showing the survey title and first questions

"This is the survey I built in Google Forms. I designed 15 questions in total, mixing three formats: Likert-scale items to measure agreement, multiple-choice questions for behavioural patterns, and open-ended prompts to hear from students in their own words.

The questions cover attendance motivation, intrinsic interest, response to feedback, participation, study routines, group work, distraction patterns, and what students would want from an online learning platform.

I ordered them from easiest to hardest, so quick Likert questions come first and the open-ended reflection questions come later. That helped keep the response rate up for as long as possible."

[1:30] Scroll through the questions briefly.

On-screen: Scroll through Q2 to Q8 (Likert), then Q9 to Q11 (open-ended)

“One design decision I want to flag: I deliberately kept the survey anonymous. No email collection, no name field. That got me more honest answers, especially on the open-ended questions where students named their real frustrations.”

PART 2: RESPONSES (2:00 to 3:00)

[2:00] Switch to Responses tab.

On-screen: *Google Forms Responses tab showing total count and auto-generated charts*

“I distributed the survey through university WhatsApp groups, class chats, and my personal student network. I collected sixteen responses, which is one above the minimum for this project.

Respondents were spread across four levels of study: about 31 percent were Year 1 undergraduates, 25 percent Year 2, another 31 percent Year 3 or above, and 12 percent were graduate students. So it wasn’t all first-years or all seniors, which gives the findings a bit more range.

One thing to be honest about: response volume dropped from sixteen to ten on the last four questions. That’s a limitation of the survey being slightly too long, and I’ve documented it in the report.”

PART 3: ANALYSIS (3:00 to 4:15)

[3:00] Switch to Excel workbook, Summary sheet.

On-screen: *Excel workbook Summary sheet*

“For analysis, I built this Excel workbook with six sheets. The Summary sheet has the key metrics and top findings up front. Below that, I have separate sheets for demographics, Likert analysis, multiple-choice breakdowns, open-ended themes, and the raw data.”

[3:30] Switch to Likert Analysis sheet.

On-screen: *Likert Analysis sheet with agreement percentages and chart*

“This is where the quantitative signal comes through. For every Likert question, I calculated an agreement percentage, which is the share of respondents who selected either Agree or Strongly Agree. The chart on the right ranks all the statements by that agreement percentage, so the strongest signals are visible at a glance.”

[3:55] Switch to Open-Ended Themes sheet.

On-screen: *Open-Ended Themes sheet showing coded themes with representative quotes*

“For the open-ended answers, I read all responses and grouped them into recurring themes. I kept the direct quotations next to each theme so any pattern I identified can be traced back to source responses.”

PART 4: THREE MAIN FINDINGS (4:15 to 5:45)

[4:15] Switch to Presentation deck, jump to Finding 01.

On-screen: *Slide 5, “Feedback is the strongest motivator,” showing 94% stat*

“Three findings stood out. The first, and the strongest signal in the entire survey: feedback is what students need most. Ninety-four percent of respondents agreed or strongly agreed that regular feedback would increase their motivation. Not a single respondent

disagreed. This came through in the open-ended answers too, where students specifically asked for constructive feedback and clear goals.”

[4:50] Switch to Finding 02.

On-screen: Slide 6, “Relevance drives, and its absence drains,” showing 87.5% stat

“Second finding: relevance. Eighty-seven and a half percent said they lose motivation when a course feels irrelevant to their future goals. One respondent even suggested the solution: a real-world impact tracker that shows how each lesson applies to actual careers or everyday problems. That idea informed one of my recommendations.”

[5:15] Switch to Finding 03.

On-screen: Slide 7, “Intention doesn’t translate to action,” showing 10% and 50% stats

“Third finding: students struggle to follow through on their own study plans. Only ten percent said they consistently do so. Fifty percent lose focus mid-way through a study session, not at the start. So this isn’t a lack of intention. It’s a gap between what students plan and what they actually execute.”

PART 5: RECOMMENDATIONS (5:45 to 6:45)

[5:45] Switch to Recommendations slide.

On-screen: Slide 9, “Recommendations for the Educational Platform,” showing the five cards

“These findings translate into five recommendations for the platform. First, build feedback into the core learning loop, not as an afterthought. Second, make relevance visible at the point of learning, using something like the real-world impact tracker students themselves proposed. Third, provide accountability scaffolding, micro-goals and streaks and small study groups, to close the plan-versus-action gap. Fourth, prioritise interactive and discussion-based content over long passive lectures. And fifth, recognise the emotional layer of learning, because students explicitly named kindness and constructive tone as things that keep them engaged.”

CLOSING (6:45 to 7:15)

[6:45] Switch back to camera-only view.

“That’s the summary. The full findings and recommendations report, the analysis workbook, the presentation deck, and the daily and weekly logs are all in the submission folder.

Thanks for watching. I’m happy to discuss any of the findings or design ideas in more detail. Assalam u Alaikum.”

[7:15] Stop recording.

After recording, before submitting:

- Watch the full video once. Check audio is clear throughout.
- Trim any long silences or false starts at the very beginning and end.
- Export at 1080p or higher, MP4 format.
- Name the file clearly: Yasha1_Week3_Demo_Video.mp4.

- If uploading to Google Drive or YouTube, set sharing to “Anyone with the link.”

If length runs long: the strongest cuts are the sections describing survey question ordering (Part 1) and the analysis workbook structure (Part 3). The findings and recommendations must stay.

If length runs short: add a specific student quote when reading each finding. Adds 30 to 45 seconds and makes the video feel less abstract.

Prepared by Yashal Manaiem Javaid | Group 43 | 28 July 2026
