

Weekly Progress Report

Week 3, Student Motivation & Engagement Survey

SafeX Solutions Internship, Group 43 Research Module
Yashal Manaiem Javaid | 21 July 2026 to 28 July 2026

1. Summary

This week's project delivered a complete cycle of primary research: designing and deploying a student motivation and engagement survey, collecting responses, analysing the data, and producing findings and design recommendations for the Educational Platform. All five step-by-step tasks and all three primary deliverables were completed on schedule.

2. Tasks Completed

- Designed 15 survey questions combining Likert-scale, multiple-choice, and open-ended formats to capture both structured and qualitative signals on student motivation.
- Deployed the survey via Google Forms and collected 16 responses across four levels of study, exceeding the 15-response minimum.
- Analysed the results in Excel, identified three primary findings and two secondary patterns, and reviewed them against open-ended themes to confirm consistency.
- Wrote a full Findings and Recommendations Report with an executive summary, methodology, findings, five design recommendations, and limitations.
- Coordinated with Group Leader Javeria Sharjeel at the start of the week to align scope with the wider Group 43 module and avoid duplication with teammates.

3. Deliverables Produced

- Survey question set (15 questions, mixed formats)
- Raw response data, anonymised, retained in the analysis workbook
- Findings and Recommendations Report (PDF)
- Excel analysis workbook (six sheets: Summary, Demographics, Likert Analysis, Multiple Choice, Open-Ended Themes, Raw Data)
- Presentation slide deck (PPTX)
- Daily work log (this week)

4. Key Findings

- **Feedback is the strongest motivator identified.** 94% of respondents agreed or strongly agreed that regular feedback would increase their motivation. The highest agreement on any Likert item in the survey.
- **Perceived relevance drives engagement.** 87.5% agreed they lose motivation when a course feels irrelevant to their future goals.
- **Students struggle to follow through on their own plans.** Only 10% consistently follow through on self-set study plans. 50% lose focus mid-way through a study session.

5. Problems Encountered and Solutions

- **Response drop-off in the second half of the survey.** Response volume fell from 16 to 10 on the last four questions, likely due to survey length fatigue.
Solution: Documented this transparently in the Findings Report limitations section. For any future round, the survey should be shorter, or the more critical items should be placed earlier in the form.
- **Some open-ended responses were very short or ambiguous.** A handful of respondents wrote one or two words, which limited what could be coded thematically.
Solution: Included these in a residual “other” category in the thematic analysis rather than forcing them into a theme. In future rounds, adding an optional prompt (“in one sentence, why?”) would help.
- **Balancing academic tone with student voice.** The Findings Report needed to feel rigorous while still preserving the direct language students used in the open-ended answers.
Solution: Used direct quotations sparingly in the report body and grouped them under representative themes in the analysis workbook, keeping the report itself concise.

6. Next Week's Plan

- Contribute the findings to the wider Group 43 synthesis, ensuring they integrate cleanly with teammates' modules.
- Refine the design recommendations into more concrete platform feature specifications, mapped to the module leader's roadmap.
- If time allows, pilot a shorter follow-up survey to test the “real-world impact tracker” concept surfaced by one respondent, since it emerged organically from the data.
- Support presentation of the findings at any Group 43 review scheduled for next week.
